C -!- FUNCTION: THE BIOLOGICAL CONVERSION OF CELLULOSE TO GLUCOSE

GENERALLY REQUIRES THREE TYPES OF HYDROLYTIC ENZYMES:

C GENERALLY REQUIRES THREE TYPES OF HYDROLYTIC ENZYMES:

(1) ENDOGLUCANASES WHICH COT INTERNAL BETA-1,4-GLUCOSIDIC BONDS;

C (2) EXCCELLOBIOHYDROLASES THAT CUT THE DISSACCHARIDE CELLOBIOSE

C (3) BETA-1,4-GLUCOSIDASES WHICH HYDROLYZE THE CELLOBIOSE AND OTHER SHORT CELLO-OLIGOSACCHARIDES TO GLUCOSE.

C -!- CATALYTIC ACTIVITY: ENDOHYDROLYSIS OF 1,4-BETA-D-GLUCOSIDIC

LINKAGES IN CELLULOSE DEGRADATION.

C -!- PATHWAY: CELLULOSE DEGRADATION.

C -!- PATHWAY: CELLULOSE DEGRADATION.

WELL AS IN OTHER C THERMOCELLUM CELLULOSOME ENZYMES. THIS DOMAIN

MAY FUNCTION AS THE BINDIK LIGAND FOR THE SL COMPONENT.

SIMILARY: BELONGS TO CELLULASE FAMILY A (FAMILY 5 OF GLYCOSYL).
                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. The sequence represents a cellulase from alkalophilic Bacillus sp. CBS 670.93, and has been isolated in recombinant form by screening of Escherichia coli clones in plasmid pT218R. The enzyme shows a delta-REM of at least 4 units, preferably at least 5 units, in the Anti Redisposition Test, strong depilling activity, fibre damage of less than 0.05 mu in the Fibre Damage Test, and adsorption of less than 15% in the Adsorption Test. The cellulase may be used in strong-activity in the Adsorption of less surfactant compositions, and in stonewashing, biopolishing, fabric softener and depilling treatment compositions (claimed). The enzyme does not accumulate on the fabric after repeated laundry washing,

    useful in detergent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cellulase isolated from novel Bacillus species – useful in detergen compsns, fabric softeners and de-pilling compsns, exhibits reduced

Example 3; Pages 51-53; 83pp; English.

This is the cloned Bacillus agaradherens endoglucanase sequence. This is used in the construction of enzyme hybrids for liquefaction of starch. The enzyme hybrids contain amino acid sequences of alpha-amylase linked to a cellulose binding domain (CBD). The starch is liquefied by treating, in aqueous medium, with such an enzyme hybrid. A recombinant expression vector comprising a construct containing isolated DNA encoding enzyme hybrids with amylolytic activity, promoter and stop signals can be used
                                                      Cloned alkaline endoglucanase protein sequence.

DNA of N-4ACMcase gene
Disclosure; Fig 3, Page 479; 12pp; Japanese.
The cellulase gene derived from Bacillus sp. No. N-4 is capable of
producing specific alkaline cellulase. The DNA can be obtd. from natural
sources or by partial synthesis, and can hybridise with DNA of N-4ACMcase
to transform host cells for the production of the recombinant enzyme hybrids. The enzyme hybrids are useful in industrial starch processing sepecially for the production of sweeteners. Hybrid enzymes have altered affinity for substrate and increased activity, resulting in at least 1 of reduced calcium ion dependence, reduced formation of Maillard reaction products and reduced effect of alpha-amylase on subsequent
                                                                                                                                                1;
                                                                                                                                                                                                                                                                               240

This protein comprises the alkaline cellulase (endoglucanase) of Bacillus agaradherens NCIMB 40482. It was expressed in Bacillus subtilis PL2306 transformants following PCR amplification (see TV4288-89) of B. agaradherens genomic DNA and ligation of the PCR product into vector pDN1981. DNA encoding the cellulose binding product into vector pDN1981. DNA encoding the cellulose binding product into vector pDN1981. DNA encoding the cellulose binding camplase-CBD hybrid enzyme (see T74290-91) for use in the construction of a novel alphamanylase-CBD hybrid enzyme (see T74271). A claimed process for emoval or bleaching of soiling or stains on a cellulosic fabric comprises contacting the fabric with a modified enzyme (enzyme hybrid) comprising a catalytically active portion of a noncellulolytic enzyme plinked to a CBD. The hybrid enzyme gives improved enzyme performance by increasing the affinity of the

This represents a Bacillus agaradherens endoglucanase enzyme. This is used in the construction of enzyme hybrids for liquefaction of starch. The enzyme hybrids contain amino acid sequences of alpha-amylase linked to a cellulose binding domain (CBD). The starch is liquefied by treating, in aqueous medium, with such an enzyme hybrid. A recombinant expression vector comprising a construct containing isolated DNA encoding enzyme hybrids with amylolytic activity, promoter and stop signals can be used to transform host cells for the production of the recombinant enzyme hybrids. The enzyme hybrids are useful in industrial starch processing especially for the production of sweeteners. Hybrid enzymes have altered affinity for substrate and increased activity, resulting in at least 1 of reduced calcium ion dependence, reduced formation of Maillard reaction

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     System for increased expression of cellulase and xylanase in Bacillus - contains gene under control of elements from B. licheniformis alkaline protease gene Disclosure; Fig 10,10A,10B, 37pp; English.

The polypeptide product (W12379) of P300-CelB fusion construct 2 (T63327) comprises a hybrid signal peptide, formed between the signal sequences of Bacillus licheniformis ATCC 53926 (P300) alkaline protease and Bacillus licheniformis ATCC 53926 (P300) and the mature CelB alkalophilic cellulase of Bacillus sp. M4. Expression in Bacillus sp. host cells of P300-CelB fusion constructs 1-4 (see also W12378-80) provides a 10-40 fold improvement in prodn. of the native gene, and an earlier start to the prodn of enzyme in the fermentation process.

Lichenifornia alkaline protease gene bisclosure; Fig 9,94,98, 37pp; English.

The polypeptide product (W12380) of P300-CelB fusion construct 3 (T63228) comprises the signal peptide of Bacillus licheniformis ATCC 53926 (P300) alkaline protease and the mature CelB alkalophilic cellulase of Bacillus sp. N4. Expression in Bacillus Sp. host cells of P300-CelB fusion constructs 1-4 (see also W12378-79, W12381) provides a 10-40 fold improvement of prodn. of the alkalophilic cellulase in comparison to expression of the native gene, and an earlier start to the prodn. of enzyme in the

The enzyme is encoded by a 11000 bp. EcoRI fragment of Bacillus spp. PL236 DNA contained in plasmid ppL591. It exhibits an endoglucanese activity of at least 10 (pref. at least 25) carboxymethyl cellulose (CMC) endoase units per mg total protein under alkaline conditions. It is especially useful as a cellulolytic agent and has been found to be more stable during washing (60 mins. at 40 deg.) in the presence of conventional detergents than a commercial cellulase preparation. It may also show increased storage stability in 11q. detergents contg.

C proteases. The sequence was deduced from the DNA (013003), it is a product of the endo3 gene. See also R13227 and R13228.

## ALIGNMENTS

A novel cellulase (W00383), designated BCE 113, of alkali-tolerant Bacillus sp. strained BCE 113, of alkali-tolerant Bacillus sp. strained BCE 113, of alkali-tolerant Bacillus sp. strained BCE 103, and a tensile strength loss to antipithing ratio below. Trean De 180 lated from CBS 669, 93 fermentation broth or expressed at high levels in transformed host cells utilising an isolated gene sequence (141849). Cellulase BCE 113, and similarly isolated cellulase BCE 103 (see also W00382), detergent compsns. to provide anti-greying, softening, anti-sequence 574 AA; (GEMV) GENENCOR INT INC.

KOTTWILZ B, Lenting HBM, Maurer K, Van Beckhoven RFWC;

KOTTWILZ B, Lenting HBM, Maurer K, Van Beckhoven RFWC;

KOTTWILZ B, 497624/49.

N-PSDB, 741849.

Cellulase with low ratio of tensile strength loss to antipilling properties - used in decergent composition which provides anti-greying, softening, anti-wrinkling and colour protection to fabrics. 27..574

Claim 1; Page 80; 96pp; English.
The enzyme is produced by transforming plasmid pPL382
DN1,885 spp. and exhibits an endoglucanase activity of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61
mg total protein under alkaline conditions. It is especially useful as a cellulolytic agent and has been found to be more stable during washing (60 mins. at 40 deg.) in the presence of conventional detergents than a commercial cellulase preparation. It may also show increased storage stability in liq. detergents contg. proteases. The sequence was deduced from the DNA (Q13002), it is a product of the endo2 gene. See also R13227 and R13229.

Clone pCNP4.1 encodes celb. It was derived as follows. N. patrictarum was used to construct a cDNA library in ZAPII (in E. coli). Transformants were selected for enzyme activity using selective media. 11 colonies were positive, and of these 10 had the same restriction pattern, and the longest of these was designated celb (pCNP4.1)(Q55036)(R47496, R4910.2). A similar process was used to isolate the xylanase clone pNx-Tac (Q55037,R47497). An enzyme composition contg. celb and xylanase is claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of celD cDNA in clone pCNP4

DNA fragment producing slightly acidic low-temp. cellulase - isolated from DNA of Runinococcus albus that is partly modified. Claim 1: Fig 1: llpp: Japanese.
The gene product is modified by a 15-24 AA N-terminal deletion and a shorter C-terminal deletion to give a gene product which has optimum activity in slightly acidic low temperature conditions. A plasmid encoding the sequence may be used to transform a host for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           rumen or silage bacteria

rumen or silage bacteria

Claim 10, Page 46-48; 71pp; English.

Clone pCNP4.1 encodes celb. It was derived as follows. N.

patriclarum was used to construct a cDNA library in ZAPII (in E.

coli). Transformants were selected for enzyme activity using

selective media. 11 colonies were positive, and of these 10 had th

same restriction pattern, and the longest of these was designated

celb (pCNP4.1)(Q55036)(R47496,R49102). A similar process was used

to isolate the xylanase clone pNX-Tac (Q55037,R47497). An enzyme

composition contg. celb and xylanase is claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (CSIR.) The present sequence represents endoglucanase isolated from Thermotoga. The enzyme or its encoding nucleic acid sequence is used for generating glucose from soluble oligosaccharides. The enzyme can be used in the food processing, pharmaceutical, textile, detergent and baking industries. The enzyme is also used to treat lactose intolerance, as a diagnostic reporter molecule, in corn wet milling or in the fruit juice industry. The enzymes can be used to hydrolyse guar gum to remove non-reducing terminal mannose residues. The nucleic acids encoding the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           62 nignalea--pfegawgv-rieheyfeiinkrgfdsvripirwsahisekppydidrnfl 118

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   baking industries
Claim 1; Fig 13a-b; 92pp; English.
This is the amino acid sequence of endoglucanase OCI/4V, deduced
from a polynuclectide (see V36919) of a Thermotoga sp. OCI/4V clone
(33GP1) that grows optimally at 75 degC. The sequence shows 65%
amino acid identity to an endo-1,4-beta-endoglucanase of
Caldocellum thermocellum. The invention provides 18 polynuclectides
(see V36907-24) coding for thermostable glycosidases (see W49888-75)
having glucosidase, alpha-galactosidase, beta-galactosidase,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        enzyme may be used to generate probes to identify similar sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                   New recombinant DNA encoding Orpinomyces cellulase protein - useful for, e.g. producing recombinant Orpinomyces cellulase in host cell claim 1; Page 38 40; 69pp; English.

This polypeptide comprises cellulase celb of Orpinomyces sp. strain oc.2, an anaerobic bowine rumen fungus Orpinomyces sp. Pc.2. Its amino acid sequence was deduced from an isolated cDNA clone (see V29477). Celb has cellobiohydrolase activity with highest activity at pH 5.2-6.2 and 50 degc. CelA (see W56738) and celC (see W56739) cellulolytic enzymes of Orpinomyces sp. Pc-2 are also provided. Recombinant DNA molecules encoding Orpinomyces cellulase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         proteins are claimed, as well as recombinant cells selected from Saccharomyces cerevisiae, Escherichia coli, Aspergillus, Trichoderma resesi, Pichia, Penicillium, Streptomyces or Bacillus, and a method for producing recombinant cellulase by culturing these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         292 iigef--vamnrdn---ed-drerwqeyyikkatalgipcviwdng-yfe 334
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  293 VLGEFGLLGFDKHTGVIQQGEKLKFFEXLIHHLNERDITHMLWDNGQHFN 342

New DNA encoding endo-glyco-ceramidase - useful in structural and functional analysis of glyco-lipid(s)

S Claim I, Page H-16; 25pp; English.

The sequences given in W10009-10 represent full length and mature endoglycoceramidase respectively, which is useful in structural and functional analysis of glycolipids in sugar chain engineering.

C Recombinant endoglycoceramidase can be produced with high purity at relatively low cost using the DNA sequences encoding these proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ervnhvvdralennltviinthhfee-l--yqepdkygdvlve---iwrqiakffkdype 172

beta-mannosidase, beta-mannanase, endoglucanase or pullulanase activity. Vectors and host cells are also claimed. A method is provided for producing the enzymes by recombinant techniques. A claimed method for generating glucose from soluble cell oligosaccharides comprises contacting a sample (selected from adairy products, fruit juice, detergent, textile, quar qum, animaled, plant biomass or waste product) containing oligosaccharides stachyose, verbascose, cellubiose, lactose, sucrose, raffinose, stachyose, verbascose, cellulose, starch, amylose, glycogen, disaccharides, polysaccharides and pullulan) with one of the sequence 360 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 326; DB 36; Length 360;

Regulatory sequence for Trichoderma viride derived cellulase cbhl gene - for producing Humicola insolens derived endo-glucanase bisclosure; Pages 48-51, 92pp; Japanese.

Disclosure; Pages 48-51, gapmisser in the specification. The specification describes a new regulatory sequence for Trichoderma viride derived cellulase cbhl gene and the establishment of a system for mass producing cellulase in moulds such as T. viride. As the regulatory sequence of cbhl genes originating in T. viride can highly express objective proteins, proteins such as cellulase can be expressed. An expression vector containing the regulatory sequence and Humicola insolens derived endo-glucanase NCS4 DNA was produced, and used to produce endo-glucanase Sequence 418 AA;
                                                                                                                                                                                               TARARA SHUZO CO LTD.

1 New DNA encoding endo-glyco-ceramidase - useful in structural and functional analysis of glyco-lipid(s)

2 Claim I: Page 11-13: 25pp; English.

2 The sequences glyon in W10209-10 represent full length and mature endoglycoceramidase respectively, which is useful in structural and functional analysis of glycolipids in sugar chain engineering.

2 Recombinant endoglycoceramidase can be produced with high purity at relatively low cost using the DNA sequences encoding these proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       29 aasgsgsgsgtal-tpsylkd-ddgrslilrgfntassaksapdgmpqfteadlareyad 86

Sisclosure; Fig 2A-C; 92pp; English.

Disclosure; Fig 2A-C; 92pp; English.

Endoglucanase-II (2C-II) is used in an animal feed-additive to produce a cereal-based animal feed, especially for fowl. EG-II any be produced recombinantly, optionally without the call-based feed (barley, wheat, triticale, rye and maize) into a cereal-based feed (barley, wheat, triticale, rye and maize) where it improves the conversion ratio and/or increases the conventional ceral-based feed to by modified by reducing its conventional ceral-based feed content while simultaneously maintaining the same nutritional levels of energy, protein and/or amino acid content while simultaneously amino acids available to the animal. The feed-additive also contains cellobiohydrolase, and optionally a xylanase, protease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      142 vnddgmtifrlpvgwgylvnnnlggtldstsiskydglvggclslgvyciidihnyar-w 200

Pure, truncated fungal cellulase protein from Trichoderma - useful to reduce or eliminate dye, colourant or pigment back-staining or reduce or eliminate dye, colourant or pigment back-staining or redeposition in stone-washing or bio-polishing Claims 17, 41, 63, 64, 65; Figure 4, 105pp; English.

Figure 4 depicts the genomic DNA and AA Sequence of EGII derived from T. longibrachiatum. A truncated fungal cellulase which consists essentially of the AA Sequence in SEQ ID no. 8 is claimed. Also claimed are DNA gene fragments encoding SEQ ID Nos: 12, 20 and 16; 16; 16 and 20; and 16, 20 and 12.

Genes for EGI and EGII have been isolated from T. longibrachiatum and the protein domain structure has been confirmed (Penttila, M. Et al., 1986, Gene, 45, 253-263; Van Arsdell, J.N. et al., 1987, En/Technology, 5, 60-64; and Saloheimo, M. et al., 1988, Gene Squence 418 AA;

                                                                                                                                                                                                                                                                                                    Disclosure; Fig 44-4C; 124,000.

The amino acid sequences for Trichoderma longibrachiatum cellobiohydrolase I (CBHI) (W02022), cendoglucanase I (EBI) (W02029), endoglucanase I (EBI) (W02029), EGHII (W02024), endoglucanase I (EGI) (W02039), EGII (W02032) and EGIII (W02034) were deduced from the respective genomic DNA sequences (T32220-24). The CBHI, CBHII, EGI and EGII enzymes have catalytic core domains useful for reducing dye redeposition (backstaining) on cellulose-contg, fabrics such as denim, whilst maintening or increasing abrasion during stonewashing. Truncated enzymes comprising these catalytic core domains can be obtd. by proteolysis of the complete enzyme or by inserting the appropriate bnA fragment into a vector, using this to transform a Trichoderma sequence 418 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         142 vnedgmtifrlpvgwqylvnnnlggnldstsiskydqlvqgclslgaycivdihnyar-w 200

Claim 1; Page 35; 49pp; English.

Trichoderma harianum (CBS 243.71) beta-(1,6)-endoglucanase may be produced recombinantly, and has a molecular weight of about 50,000, an apparent isoelectric point of 5.6, an optimal temperature of 30-40 deg, an optimal pH of 4-6, preferably 5, and a specific activity of about 100 U/mg. The enzyme, or compositions enriched in it, are used to modify or degrade beta-glucans, particularly for rupturing or lysing cell walls of microorganisms thereby enabling recovery of desirable products produced by the microorganisms.

Typical applications include the production of protoplasts and yeast extracts, use in wine and press juice making, as fungicides, to remove excess dye from textiles, to remove moulds on coatings or

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 51.634; Variance 110.240; scale 0.468

part of this sequence, including the amino end of the
##note part of this sequence, including the amino end of the
mature protein, was confirmed by protein sequencing
T This secretory enzyme is part of a highly active and thermostable
cellulase complex that is involved in extracellular cellulose
degradation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    duplication: extracellular protein; glycosidase; hydrolase;

J. Gen. Microbiol. (1993) 139:3233-3242
Cloning of an endo-(1-->4)-beta-glucanase gene, celA, from
the rumen bacterium Clostridium sp. ('C. longisporum') and
cehracterization of its product, CelA, in Escherichia coll:
140798
                                                                                                                                                                                     Gaps 20;
